

# Energy Saving Bookmarklet

What if I told you that in one line of code you could hack Google to save electricity? We are not actually going to hack Google's servers (that would be unethical!), but we can trick our browser into displaying pages with a black background instead of a white background. This will work on most webpages, including Google Search!

This works by taking advantage of a little known feature: did you know that you can execute javascript code on any page by entering it into the url bar of your browser?

Why not test it now?

```
javascript:alert('Hello World');
```

Aaaannnd since your browser can save url's (as bookmarks), we are going to take advantage and save one line of JavaScript code just as if it was a web-address. When the bookmark is clicked, it will run our code!

## Instructions

1. Open Google Chrome. From 'View', make sure 'Always show bookmarks bar' is checked.
2. From 'Bookmarks', select 'bookmark this page'.
3. Change the name. Make sure 'Bookmarks Bar' is selected. click 'Edit'.
4. Insert the following code in the URL box, and save.

```
javascript:(function(){document.body.style.backgroundColor='black';})();
```

5. Finally go to google.com and click the bookmark's button in the bookmark bar!
